

The Anis Trend Automatic Baler has up to 20 pre-programmable settings to handle a variety of material types

Going that extra mile

Autobaler's clients include some well-known organisations

■ AUTOBALER (PART OF ECS), BASED IN LANCASHIRE, SPECIALISES IN THE SUPPLY AND integration of high-quality automatic baling and recycling equipment. Established as a limited company in 2006, it has grown rapidly, building a customer base to include some of the best known organisations within the UK such as Marks & Spencer, JJB Sports, DHL Exel Supply Chain, Kimberly-Clark, The Returns Company and many more.

The rebranding of ECS to Autobaler is an exciting milestone in the development of the company becoming one of the leading suppliers of integrated recycling systems in the UK. This instantly recognisable name will attract a wide range of clients who will benefit from Autobaler's industry experience.

During the past two-and-a-half years, ECS has worked with Marks & Spencer to provide dedicated recycling areas for packaging waste at nine distribution warehouses. In addition to the supply of the Anis Trend Automatic Baler, these turnkey projects included the provision of portal frame buildings to house equipment along with feed conveyors.

Other recent Autobaler installations provided systems for product destruction, and included the manufacture of bespoke heavy-duty conveyors and integration of the AXO Shredder with its unique single-piece shaft design.

ECS managing director Jeff Jones says: "We are proud to have developed a satisfied customer base

through dedicated service. Much of our business is gained from recommendation and ongoing service to existing clients. Our equipment can be used in many sectors including warehouse and distribution, waste management, local authority and manufacture."

The Anis Trend Automatic Baler, manufactured in Europe since 1994, is a robust machine engineered to produce a reliable and simple to operate press. With up to 20 pre-programmable settings, the balers are suitable for several material types, including paper, cardboard, polythene films, PET bottles and aluminium cans.

Many components can be sourced within the UK, the hydraulic system being manufactured from Dennison and Parker components. In addition, Autobaler carries a comprehensive range of spare parts in Lancashire.

From initial site survey through to installation, Autobaler offers complete project management to ensure minimal disruption to on-site operation, whatever the scale or location. Scope of supply is tailored to suit individual applications, whether it is the manufacture of a feed system or the erection of a portal steel building where space may be at a premium.

The extensive knowledge that ECS holds within both the baling and waste sectors, coupled with its efforts to go that extra mile, provides the perfect solution to waste handling requirements. ■
